

Sector Application Guidance

Operational Interpretation of Strict Liability Across
*Economic, Governmental, Organizational, Professional, and Educational
Domains*

Parent Document S.E.P.A. Discussion Draft v1.0	Addendum Version 1.0 — Discussion Draft
Prepared by Jeffrey Wallk	Date May 2026

Addendum Sections

A — Economic Sectors and Markets | B — The State and Government
C — Non-Extractive Governmental Exploitation | D — Organizations by Type
E — Licensed and Expert Professions | F — Education

NOTICE: This addendum is a discussion draft companion to S.E.P.A. v1.0 and carries identical advisory status.

ADDENDUM PREAMBLE — PURPOSE AND STRUCTURE

The Systemic Exploitation Prevention Act (S.E.P.A.) establishes a general strict-liability prohibition against exploitation and creates the institutional infrastructure necessary to enforce it. The core statute is, by design, sector-agnostic: it defines exploitation as a behavioral anomaly, not as a category of transaction confined to any particular industry, institution, or relationship.

This Addendum provides sector-specific interpretive guidance across six domains, demonstrating how the Act's definitions and standards apply to the operational mechanics of distinct sectors. It is structured as a companion to the core statute, not as a limitation of it. Nothing in this Addendum restricts the general prohibition in Section 3 of S.E.P.A. to the enumerated examples herein. The examples are illustrative, not exhaustive.

HOW TO READ THIS ADDENDUM

Each section identifies the relevant SEPA provision, the structural asymmetry that enables exploitation in that domain, specific behavioral patterns, the strict-liability application, and the systemic shift produced by enforcement. The three-row behavior table (Behavior / Application / Systemic Shift) is the core unit of analysis in each section. The absence of a sector from this Addendum does not imply that sector is exempt from the Act.

The analytical framework across all six sections is consistent with the five design principles stated in the core statute's Drafting Notes:

- (1) Behavioral designation, not transactional classification;
- (2) Structural asymmetry as the primary enabling condition;
- (3) The Exploitation Harm Index (EHI) as the measurement instrument;
- (4) Reparation as restoration, not merely penalty; and
- (5) Personal liability for natural persons whose decisions produce irreversible harm.

ADDENDUM A — ECONOMIC SECTORS AND MARKETS

This section addresses the application of S.E.P.A. to the primary domains of commercial economic activity, including corporate strategy, financial markets, technology platforms, healthcare delivery, environmental infrastructure, workplace relations, and interpersonal financial relationships. In each domain, the structural asymmetry that enables exploitation differs, but the analytical framework is identical: identify the behavioral anomaly, measure the resulting harm, and hold the responsible Actor strictly liable.

A.1 — Corporate Strategy and Financial Markets

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(b), 3.2, 3.3(g); SEPA Preamble (b)
----------------	---

Core Asymmetry	Capital ownership vs. labor dependency; shareholder primacy doctrine vs. community welfare
Scope	Private equity operations, publicly traded corporations, asset management, hedge funds

The traditional defense of fiduciary duty to maximize shareholder value has functioned as a comprehensive immunity shield for extractive capital strategies. S.E.P.A. voids that defense by designating fiduciary duty-to-shareholders as non-controlling where it produces measurable harm to Vulnerable Parties, communities, or natural systems.

EXPLOITATIVE BEHAVIOR PATTERN	
Behavior:	Private equity asset stripping; stock buybacks paired with mass layoffs; engineered corporate insolvency to dissolve pension obligations; planned obsolescence designed to generate recurring replacement revenue.
Application:	The indirect harm of asset stripping is empirically traceable. Stripping a regional hospital network produces measurable negative health outcomes in the affected zip codes — increased mortality, delayed diagnoses, emergency department overload. The EHI captures this causal chain. The institution, and the natural persons who executed the strategy, are strictly liable for reparations to the affected community. The 'shareholder value' argument is not a defense; it is a description of the mechanism of extraction.
Systemic Shift / Penalty:	Capital allocation calculus is permanently altered. When asset-stripping a hospital generates a personal incarceration risk for the private equity partners who approved it, the risk model changes at the decision point. Corporate dissolution is available as a remedy for persistent asset-stripping patterns. Reparations are calculated against the full EHI-measured community harm, not merely the direct financial loss.

A.2 — Technology Platforms and Autonomous Systems

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(a)(b)(c), 3.3(a)(b); Drafting Note — EHI as Load-Bearing Member
Core Asymmetry	Algorithmic opacity vs. user psychological vulnerability; technical complexity vs. regulatory comprehension
Scope	Social media platforms, AI systems, autonomous recommendation engines, data brokers

Technology platforms occupy a uniquely dangerous position under S.E.P.A. because their exploitation is often invisible to its victims, distributed across millions of interactions, and rationalized through the industry norm of 'optimization.' The Act's strict liability standard treats 'we were optimizing for engagement' with precisely the same legal weight as 'I was just following orders' — as a description of the exploitative mechanism, not an excuse for it.

EXPLOITATIVE BEHAVIOR PATTERN	
Behavior:	Algorithmic bias causing measurable harm to specific demographics; unchecked data harvesting from vulnerable populations including minors; deployment of recommendation systems empirically linked to adolescent mental health degradation or radicalization; 'moving fast and breaking things' as a substitute for pre-deployment safety assessment.

Application: Deploying an algorithm that demonstrably harms a demographic — even as a byproduct of profit-seeking optimization — is classified as exploitation. The standard is not intent; it is outcome. If a social media platform's internal research documents demonstrate that its recommendation system increases rates of eating disorders among adolescent girls, and the platform deployed and maintained the system despite that knowledge, the behavioral anomaly is triggered. The architects, executives, and engineers who designed, approved, and maintained the system are strictly liable.

Systemic Shift / Penalty: S.E.P.A. mandates a high-assurance trust measurement protocol for any platform deploying autonomous systems at scale. Platforms cannot be deployed without empirical pre-deployment safety certification equivalent to the aviation standard for flight control systems. Software engineers' professional certification becomes a strict-liability instrument: signing off on a system that produces measurable psychological harm makes the engineer personally liable alongside the platform. 'I was just writing the code I was assigned' is not a defense under strict liability.

A.3 — Healthcare Delivery and Pharmaceuticals

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(a)(b), 3.3(b); Preamble (c)
Core Asymmetry	Medical literacy asymmetry; life-or-death dependency; insurance claim opacity
Scope	Health insurers, pharmaceutical manufacturers, hospital systems, pharmacy benefit managers

Healthcare exploitation is among the most direct and documentable categories of harm under S.E.P.A. because the causal chain from exploitative act to physical harm to measurable outcome is often clinically traceable. Profiting from illness while causing direct harm through denial or indirect harm through medical bankruptcy represents the core behavioral anomaly the Act was designed to address.

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Denying insurance claims for medically necessary procedures to boost quarterly profits; price gouging for life-saving medications whose development was publicly subsidized; suppressing generic drug competition to maintain monopoly pricing; pharmaceutical marketing incentives that drive physician overprescription of addictive compounds.

Application: By making intent irrelevant, an insurance adjuster or executive denying a necessary procedure is not making a business decision — they are triggering a liability event. The EHI captures both the patient's physical harm and their financial harm (medical debt, lost wages, diminished life expectancy). Pharmaceutical executives who price insulin at levels that cause diabetic patients to ration doses resulting in hospitalization or death are strictly liable for the harm, irrespective of the company's legal right to set pricing.

Systemic Shift / Penalty: The penalty requires restoring both the patient's health and their financial baseline. Where irreversible harm — death, permanent disability — has occurred, the natural persons who designed the denial policies or pricing structures face criminal liability under Section 5.2(a). Pharmaceutical companies that suppressed research demonstrating addiction risk face dissolution and asset transfer to remediation funds proportional to the population-level harm caused.

A.4 — Environmental and Public Infrastructure

SEPA Reference	S.E.P.A. Sections 2.2(d)(e), 3.3(h); Preamble (c)(g)
Core Asymmetry	Industrial information monopoly vs. community environmental dependency; regulatory access vs. public powerlessness
Scope	Chemical manufacturers, fossil fuel producers, municipal water authorities, infrastructure operators

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Industrial dumping and groundwater contamination; deferring maintenance on public utilities to redirect capital to executive compensation or debt service; externalizing the cost of carbon emissions onto the public and future generations; using regulatory complexity to delay remediation for decades.

Application: Externalities are no longer legally free under S.E.P.A. An industrial Actor cannot spend decades in litigation arguing about precise toxicity thresholds when the behavioral anomaly — exploitation of a shared natural system for private gain at community expense — is empirically documented. The EHI calculates harm across the full affected population, including intergenerational health outcomes, without requiring proof of malicious intent. The harm occurred. The exploitation is measurable. Liability attaches.

Systemic Shift / Penalty: Reparations are forced directly onto the polluting entity to physically remediate the environment and medically compensate the community at a cost calibrated to the full EHI score. Where the contamination is irreversible — permanent aquifer destruction, species extinction, established cancer cluster — the decision-makers who authorized or continued the practice face incarceration under Section 5.2(a). Infrastructure operators who deferred maintenance to generate executive bonuses, producing a bridge collapse or water system failure, are jointly liable with the public officials who permitted the diversion.

A.5 — The Workplace and Management Relations

SEPA Reference	S.E.P.A. Sections 2.1, 2.4, 3.3(c); Preamble (a)
Core Asymmetry	Employment dependency vs. managerial authority; economic survival vs. organizational hierarchy
Scope	All employers; management structures; labor relations; union-busting operations; NDA enforcement

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Wage theft; chronic overwork without compensation producing measurable burnout, psychological harm, or physical health crises; using Non-Disclosure Agreements to silence workplace abuse victims; coordinated union-busting operations; toxic management cultures rewarding sociopathic behavior.

Application: Exploiting a power differential for professional or financial gain at the expense of a subordinate's psychological or economic well-being is outlawed. A manager who chronically overworks employees without compensation, producing a measurable spike in stress-related illness, anxiety disorders, or employee mortality, has committed exploitation. The EHI measures the workforce harm. The employer and the individual managers who designed or enforced the exploitative structure are strictly liable. NDA deployment to silence victims is not a contractual privilege — it is an instrument of ongoing exploitation and itself a triggering act under Section 2.1.

Systemic Shift / Penalty: Because repeat offenses demonstrate recurrence without caring under Section 5.2(b), toxic actors are permanently removed from management authority via incarceration or professional prohibition. Union-busting operations that document the deliberate suppression of workers' collective bargaining rights — a measurable harm to the financial and psychological welfare of the workforce — are treated as coordinated exploitation, with liability attaching to the law firms, consultants, and executives who orchestrated them.

A.6 — Interpersonal and Domestic Financial Relationships

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(a)(b), 2.4; Preamble (a)(c)
Core Asymmetry	Intimate trust vs. financial control; elder cognitive vulnerability vs. caretaker access
Scope	Domestic financial abuse; elder exploitation; coercive financial control; predatory guardianship

While S.E.P.A. is primarily designed to address systemic and institutional exploitation, its strict-liability framework extends to interpersonal relationships where a documentable power asymmetry produces measurable financial or psychological harm. The Act provides a legal mechanism to intervene in coercive dynamics before they escalate to physical violence, which is currently the threshold at which most state intervention occurs.

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Systematic deprivation of a partner's access to shared financial resources as a control mechanism; elder exploitation involving the extraction of assets from cognitively vulnerable individuals; predatory guardianship structures that strip legal autonomy and estate control from vulnerable adults.

Application: If one partner systematically deprives another of access to marital resources, and that deprivation produces measurable financial harm, psychological harm documented by clinical assessment, and diminished capacity for independent exit, the extraction meets the definition of exploitation under Section 2.1. The focus on measurable harm rather than physical violence provides a legal mechanism for intervention at the control stage rather than the assault stage.

Systemic Shift / Penalty: Financial reparations restore the harmed party to their pre-exploitation financial baseline. Where the exploitation is documented as recurrent or irreversible — such as complete estate depletion of a person with dementia — the perpetrator faces criminal liability under Section 5.2(a). Courts are authorized to impose protective financial structures, asset freezes, and supervised accounting as remedial measures without requiring a showing of physical harm.

ADDENDUM B — THE STATE AND GOVERNMENT: EXTRACTIVE EXPLOITATION

Applying S.E.P.A. to the state itself is the Act's most structurally significant application. Historically, governments insulate themselves from the consequences of their own machinery through legal force fields: sovereign immunity, qualified immunity, and absolute immunity. These doctrines dictate that the state and its agents cannot be sued or prosecuted for performing their official duties, even when those duties result in catastrophic damage.

S.E.P.A.'s prohibition contains no carve-out for governmental status. When motivation is irrelevant and only the behavioral anomaly of extraction-without-care matters, elected officials, appointed administrators, and judicial officers are reduced to system nodes subject to the same liability framework as any other Actor. If their outputs cause measurable harm for the benefit of themselves or their institutional donors, they trigger the same failure-state penalties as a corporate executive.

NULLIFICATION OF GOVERNMENTAL IMMUNITIES

The Act expressly supersedes sovereign immunity, qualified immunity, and absolute immunity doctrines as they have historically shielded officials from accountability for exploitative conduct. No immunity doctrine survives the demonstration that the official's act produced measurable exploitation harm as defined in Section 2.2. This is a constitutional question that the drafting of this Act presupposes will require parallel constitutional amendment or Supreme Court reinterpretation — see Drafting Note in Addendum B.4.

B.1 — The Legislative Branch

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(b)(e), 3.3(f)(g); Preamble (b)(d)
Core Asymmetry	Legislative authority over law vs. public dependency on equitable lawmaking; campaign finance access vs. constituent welfare
Scope	Members of Congress; state legislators; legislative staff; lobbyists as co-conspirators in regulatory capture

EXPLOITATIVE BEHAVIOR PATTERN

- Behavior:** Legalized bribery through lobbying; insider trading based on classified committee briefings; passing legislation authored by corporate interests (tax loopholes, deregulation of rail safety, gutting of environmental standards); deliberate underfunding of public agencies to manufacture a pretext for privatization.
- Application:** A Senator voting to dismantle environmental regulations cannot hide behind the ideological shield of fiscal conservatism or deregulation. If the policy is enacted and a measurable spike in illness, environmental degradation, or poverty follows, the legislators who authored and voted for it are strictly liable for the indirect harm. The EHI traces the causal chain from legislative act to population outcome. The fact that the vote was legal is not a defense — it is a description of how the exploitation was authorized.
- Systemic Shift / Penalty:** Because Congress routinely enacts harmful policies with full statistical knowledge of their consequences, recurrence constitutes 'recurrence without caring' under Section 5.2(b). The penalty includes personal financial reparations extracted from the legislator's wealth to remediate damaged communities, permanent removal from office, and incarceration for irreversible

systemic harm. Lobbyists who demonstrably authored harmful legislation are co-liable as Actors under Section 2.3.

B.2 — The Executive Branch

SEPA Reference	S.E.P.A. Sections 2.1, 2.6, 3.3(f); Preamble (f)
Core Asymmetry	Monopoly on enforcement power vs. public reliance on impartial administration; appointment authority vs. regulatory independence
Scope	President; Cabinet secretaries; regulatory agency heads; senior executive personnel in federal agencies

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Regulatory capture through strategic appointment (fossil fuel executives running environmental agencies; banking executives running financial regulators); deploying state violence against peaceful protesters to protect private corporate interests; delaying disaster relief for political leverage; accelerating pharmaceutical or product approval to benefit manufacturers at public health expense.

Application: If an FDA administrator speeds through approval of a pharmaceutical drug to benefit a manufacturer, and the drug causes mass addiction or death, the administrator cannot claim they were following accelerated agency protocols. The extraction of public health for corporate benefit occurred under their authority. They are personally liable for the remediation. A President who deploys federal agencies to suppress legitimate labor organizing — producing measurable harm to workers' economic welfare — has committed governmental exploitation.

Systemic Shift / Penalty: The executive branch is governed by the same high-assurance trust measurement infrastructure as any other Actor. OHM monitoring of agency conduct is continuous, not complaint-driven. Agency heads whose policy decisions demonstrably harm Vulnerable Parties face personal civil liability and, where harm is irreversible, criminal liability. The OEP is authorized to investigate executive branch conduct without executive branch permission — structural independence is constitutionally required for this provision to function.

B.3 — The Judicial Branch

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(b)(e), 3.3(f); Preamble (f)
Core Asymmetry	Judicial authority vs. litigant dependency; absolute immunity doctrine vs. accountability for harm
Scope	Federal and state judges; Supreme Court Justices; judicial officers; court administrators

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Accepting undisclosed financial gifts from parties with matters before the court; rulings that systematically expand corporate power at the expense of Vulnerable Parties; weaponizing procedural complexity or docket management to deny justice to underfunded plaintiffs; rulings enabling environmental exploitation that directly produces community harm.

Application: Judges are currently shielded by absolute immunity for their judicial acts. S.E.P.A. strips that immunity where judicial conduct produces a documentable exploitation outcome. If a Supreme Court Justice rules to dismantle federal oversight of corporate pollution, and that ruling directly enables a chemical spill that poisons a municipality, the Justice's conduct is subject to EHI assessment. The financial and social relationships of appointed judges are subject to full transparency requirements — accepting a gift from an entity that benefits from a ruling is not an ethics violation; it is a documentable behavioral anomaly triggering removal, reparations, and potential incarceration.

Systemic Shift / Penalty: The independence of the judiciary from OHM oversight is not a structural exemption — it is a structural threat. Judicial independence means independence from political interference in ruling on specific cases; it does not and cannot mean immunity from accountability for the measurable harm produced by rulings that exploit the power asymmetry between the court and the public. Judges whose conduct demonstrates recurrence face removal, personal financial liability, and incarceration.

B.4 — Enforcement Architecture for Governmental Exploitation

To prevent the government from self-immunizing against the Act's provisions through internal watchdog capture, S.E.P.A. mandates that governmental exploitation be investigated and prosecuted through the same OHM/OEP architecture established in Section 4 of the core statute — not through Inspectors General, congressional ethics committees, or internal review mechanisms, all of which are subject to the political control of the entities they oversee.

The Act requires a unified semantic governance framework — an immutable, publicly accessible architecture that tracks legislative votes, agency actions, judicial rulings, and executive decisions down to the localized physical harm they produce. When a bridge collapses, this architecture traces the failure not only to the structural failure point, but to the specific appropriations committee member who diverted the maintenance funding, the agency administrator who approved the reallocation, and the lobbying expenditure that motivated both. All nodes in the causal chain are subject to proportional liability.

DRAFTING NOTE — Constitutional Dimensions

The application of S.E.P.A. to federal officials, particularly Article III judges, raises constitutional questions regarding separation of powers and existing immunity doctrines. This Act presupposes that full enforcement against governmental actors will require either: (a) a constitutional amendment explicitly establishing accountability for governmental exploitation as a fundamental right of the governed; (b) Supreme Court reinterpretation of immunity doctrines in light of the Act's documented harm standard; or (c) a structural redesign of judicial tenure and oversight. The drafters regard option (a) as the cleanest path and recommend parallel advocacy for a Governmental Accountability Amendment to accompany this legislation.

ADDENDUM C — NON-EXTRACTIVE GOVERNMENTAL EXPLOITATION

The forms of governmental exploitation addressed in Addendum B are primarily extractive — they involve the transfer of material value from Vulnerable Parties to governmental actors or their institutional beneficiaries. This section addresses a distinct and equally dangerous category: non-extractive governmental exploitation, in which the harm derives not from financial extraction but from the abuse of authority, the weaponization of information asymmetry, the manipulation of democratic mechanisms, or the deliberate neglect of a fundamental duty of care.

Non-extractive exploitation is often more difficult to prosecute under existing law precisely because no money changes hands and no discrete criminal act can be identified. S.E.P.A.'s behavioral anomaly standard — which requires only the demonstration of asymmetric power used to cause measurable harm — closes this gap.

C.1 — The Legislative Branch: Non-Extractive Exploitation

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(b)(e), 3.3(f); Preamble (c)(d)
Core Asymmetry	Mathematical control of electoral architecture vs. voter dependency on representative democracy; legislative information access vs. public informational reliance
Scope	Gerrymandering; stochastic violence incitement; deliberate agency starvation; disinformation as legislative tool

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Gerrymandering district maps to mathematically disenfranchise voters; weaponizing cultural misinformation about marginalized groups to incite stochastic violence; deliberately starving public agencies of funding to manufacture failure as a pretext for privatization; using legislative gridlock as an instrument of harm.

Application: A legislator does not need to accept a bribe to be guilty of exploitation. Gerrymandering exploits the mathematical mechanics of the electoral system to cause measurable harm to the democratic representation of a specific population. If politicians deploy verifiable misinformation about a marginalized group and that group subsequently suffers measurable increases in violence or systemic discrimination, the legislators are strictly liable. They exploited a population's vulnerability for political survival — a behavioral anomaly under Section 2.1 regardless of the absence of financial extraction.

Systemic Shift / Penalty: The systemic remediation is civic, not only financial. Non-extractive legislative exploitation triggers immediate forfeiture of office, invalidation of manipulated electoral maps, and incarceration for deliberately degrading the civic safety of the population. Misinformation that produces localized increases in hate crimes triggers joint civil liability for the legislators and media entities that amplified it.

C.2 — The Executive Branch: Non-Extractive Exploitation

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(a)(b), 3.3(f); Preamble (f)
Core Asymmetry	State information control vs. public reliance on governmental truth-telling during crisis; classification authority vs. democratic accountability

Scope

Crisis information management; classification abuse; public health data suppression; emergency response manipulation

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Managing public perception through deceit during a public health or environmental crisis to protect political capital; exploiting the classification system to conceal human rights abuses; delaying or falsifying emergency response data for political advantage.

Application: The Executive branch controls the flow of state information and emergency response. If an administration possesses data showing a chemical spill is highly toxic but tells the public the air is safe — to prevent panic or protect a corporate ally — no money is extracted. But the behavioral anomaly is the deliberate creation of an information asymmetry that compromises public safety. The indirect harm is the resulting illness in the population who relied on false state assurances. This is exploitation of the public's trust and dependency on the state's informational authority.

Systemic Shift / Penalty: Administrators personally liable for the physical harm caused by information suppression face severe incarceratory penalties for recurrence — treating the suppression of vital public safety data as a systemic act of violence against the population that depends on it. The EHI measures the population health outcomes attributable to the information asymmetry, not merely the existence of the false statement.

C.3 — The Judicial Branch: Non-Extractive Exploitation

SEPA Reference

S.E.P.A. Sections 2.1, 2.2(b)(e), 3.3(f)

Core Asymmetry

Procedural authority vs. litigant resource exhaustion; docket control vs. justice-dependent vulnerability

Scope

Shadow docket abuse; procedural exhaustion as a weapon; systemic delay that produces abandonment of meritorious claims

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Weaponizing the shadow docket to pass unreasoned rulings that alter legal landscapes without substantive review; allowing corporate defendants to bury plaintiffs in frivolous procedural motions until resource exhaustion forces abandonment of meritorious claims; maintaining a labyrinthine legal architecture that functions as a de facto denial of justice to parties without massive legal resources.

Application: If a judge continuously permits a corporate defendant to delay trial through frivolous motions — knowing the plaintiffs will exhaust their resources and abandon the case — the judge is complicit in exploitation. They are exploiting procedural authority to enforce an asymmetry of power between a well-resourced corporate defendant and an underfunded community plaintiff. No money is extracted from the judge, but the harm to the community is measurable and the behavioral anomaly is documented.

Systemic Shift / Penalty: The judge's conduct is flagged as a systemic anomaly by the OHM's semantic governance framework, which tracks case outcome patterns against litigant resource profiles. Judges whose docket management consistently produces resource-exhaustion abandonment of meritorious claims — particularly where corporate defendants are beneficiaries — face removal from the bench and joint liability for the un-remediated harm to the plaintiffs whose cases were structurally defeated.

ADDENDUM D — ORGANIZATIONS BY TYPE

S.E.P.A. evaluates all Actors by the same standard regardless of their tax status, mission statement, or institutional identity. The analytical question is not what an organization claims to be, but what its operational architecture actually does: does it rely on an asymmetry of power or information to cause measurable direct or indirect harm? This section applies that standard to for-profit companies, not-for-profit organizations, and religious institutions.

D.1 — For-Profit Companies

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(a)(b)(d), 3.3(a)(b)(h); Section 7(e)
Core Asymmetry	Information asymmetry between product designers and consumers; market dependency vs. producer power; psychological vulnerability vs. engagement optimization
Scope	Consumer product manufacturers; technology companies; pharmaceutical companies; financial products

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Planned obsolescence engineered to force recurring replacement revenue while externalizing e-waste harm; social media recommendation algorithms empirically linked to psychological degradation or radicalization; deceptive marketing; supply chain toxicity externalized to producing communities.

Application: In a for-profit context, exploitation frequently manifests as the deliberate degradation of product safety, durability, or user welfare to sustain revenue extraction. If a tech company intentionally designs a device with a self-degrading component while using proprietary fasteners to prevent repair, it is exploiting the consumer's reliance on the device and externalizing environmental harm to the public. If a platform deploys a recommendation algorithm it knows empirically drives users toward self-harm to maximize engagement, the motivation — optimization — is irrelevant. The harm is measurable. The behavioral anomaly is triggered.

Systemic Shift / Penalty: Companies and their leadership are strictly liable for resulting psychological and environmental damage. Reparations fund mental health remediation for affected users and physical cleanup of externalized waste. The product cannot remain on the market until it passes the OHM's high-assurance trust measurement certification. Pre-deployment empirical safety certification is mandatory for any product whose design relies on behavioral manipulation for engagement metrics.

D.2 — Not-for-Profit Organizations

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(b)(e), 3.3(f); Preamble (a)(c)
Core Asymmetry	Institutional expertise and narrative control vs. beneficiary dependency; donor-class interests vs. community welfare
Scope	Advocacy nonprofits; social service organizations; foundations; housing organizations; food security organizations

Non-profit tax status is not immunity. The Act evaluates non-profits on the same behavioral standard as any other Actor: does the operational architecture of the organization exploit the

vulnerability of the population it claims to serve, for the institutional benefit of its leadership or donor base?

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: The savior complex economy: maintaining a perpetual state of crisis among beneficiaries to sustain grant revenue and executive salaries; quietly opposing legislative or policy solutions that would structurally solve the problem the organization is funded to address, because solving it would render the organization obsolete; exploiting beneficiary trauma narratives for fundraising while delivering minimal structural benefit.

Application: If a nonprofit raises significant capital to combat homelessness but its leadership quietly lobbies against local zoning changes that would build affordable housing — because solving the crisis would eliminate the grant revenue stream — it is exploiting the continued suffering of the unhoused to maintain institutional power. The behavioral anomaly is the calculated inaction that demonstrably prolongs the harm the organization is chartered to eliminate. Tax-exempt status is not a defense. The causal relationship between the inaction and the sustained harm is measurable.

Systemic Shift / Penalty: Non-profit status provides no immunity. If the organization's documented actions or calculated inactions demonstrably prolong the harm they are chartered to eliminate, leadership faces immediate removal and the organization's assets are seized and directly deployed to the community for actual systemic remediation. The OHM maintains ongoing monitoring of non-profit outcome data against stated mission metrics.

D.3 — Religious Organizations

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(a)(b)(c), 2.4; Preamble (a)(c)
Core Asymmetry	Claimed divine authority vs. congregant spiritual vulnerability; institutional reputation vs. victim protection; financial coercion under doctrinal framework
Scope	Churches, mosques, temples, religious schools, faith-based social service organizations

Freedom of religion does not equal freedom to exploit. S.E.P.A. does not regulate belief, doctrine, or theological practice. It regulates behavior that produces measurable harm by exploiting the power asymmetry inherent in the relationship between a religious institution and its congregation. The claim of divine authority is perhaps the most profound information asymmetry in human social organization; it does not insulate the institution from accountability for the harm it produces.

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Using spiritual authority to mandate financial contributions from congregants who cannot afford food or medical care; systematically protecting abusers within the institution to preserve its public image, reputation, and enrollment; using theological doctrine to manufacture manufactured consent to harmful institutional practices; tax-exempt wealth accumulation while extracting from impoverished congregants.

Application: A religious leader who mandates tithing from congregants who cannot afford food or medical care — weaponizing belief to cause indirect physical and financial harm — has committed non-extractive exploitation under Section 2.1. Furthermore, if the institutional architecture of the organization systematically protects abusers to preserve enrollment metrics, it is exploiting the vulnerability of victims through the mechanism of institutional authority. The separation of church and state does not protect institutions from liability for measurable harm.

Systemic Shift / Penalty: Reparations are extracted directly from the institution's untaxed holdings to compensate victims. Leaders who orchestrated or covered up harm face incarceration for recurrence without caring under Section 5.2(b). Religious organizations that have operated systematic abuse-protection architectures are subject to dissolution with assets transferred to a remediation fund for affected communities.

ADDENDUM E — LICENSED AND EXPERT PROFESSIONS

When S.E.P.A. is applied to individual professions, it is fundamentally regulating the asymmetry of expertise. Licensed professionals hold a monopoly on specific, highly complex domains of knowledge that the public cannot independently audit. A patient cannot verify a diagnosis; a community cannot independently assess a structural load calculation; a consumer cannot audit the methodology of a clinical trial. The public must simply trust the professional.

Under S.E.P.A., weaponizing that asymmetry to cause measurable harm for personal, professional, or institutional gain is a strictly liable offense. The defenses of 'standard industry practice,' 'client confidentiality,' and 'zealous advocacy' do not survive the demonstration of a behavioral anomaly producing measurable harm.

E.1 — Healthcare Professionals

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(a)(b), 2.4; Section 3.3(b)
Core Asymmetry	Medical literacy monopoly vs. patient physical vulnerability; physician authority vs. patient dependency
Scope	Physicians, nurses, administrators; pharmaceutical prescribing chains; hospital billing architectures

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Patient churning to meet administrative billing quotas; overprescribing addictive medications due to pharmaceutical incentives; performing profitable but medically unnecessary procedures; hospital administrators imposing visit-time constraints that produce measurable diagnostic error rates.

Application: Under existing malpractice law, physicians must deviate from the 'standard of care' — a subjective metric often defended by fellow physicians. S.E.P.A. shifts the focus to the behavioral anomaly of extraction. If a physician prescribes an opioid off-label because they receive speaking fees from the manufacturer and the patient becomes addicted, the physician exploited their medical authority. Crucially, the Act travels up the chain of command: if a hospital administrator institutes a seven-minute patient visit policy that produces a measurable spike in misdiagnoses, the administrator — not the individual physician — bears primary strict liability for exploiting both the physicians' professional constraints and the patients' health.

Systemic Shift / Penalty: The professional certification seal becomes a strict-liability instrument. Physicians who design or participate in prescribing arrangements driven by pharmaceutical financial incentives face personal civil liability and, where addiction or death results, criminal liability. Hospital administrators whose operational policies produce measurable patient harm face reparation obligations calibrated to the full EHI score of the affected patient population.

E.2 — Legal Professionals

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(b)(e), 3.3(f)
Core Asymmetry	Legal system fluency vs. lay dependency; prosecutorial power vs. defendant vulnerability

Scope

Civil litigators; prosecutors; public defenders; legal aid lawyers; corporate defense firms

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Predatory billing designed to exhaust client resources; SLAPP suits designed to bankrupt critics; prosecutors withholding exculpatory evidence to secure convictions and advance careers; corporate defense attorneys burying underfunded plaintiffs in frivolous discovery to force settlements.

Application: Zealous advocacy is the current shield for legal exploitation. Under S.E.P.A., weaponizing the complexity of the legal system to cause financial or physical harm is outlawed. A corporate defense attorney who intentionally buries an underfunded plaintiff in years of frivolous discovery — knowing the client is guilty of poisoning a watershed — is actively exploiting procedural rules to enforce a power asymmetry, resulting in un-remediated environmental harm. A prosecutor who knowingly relies on compromised testimony or suppresses exculpatory evidence to secure a conviction has exploited the power of the state to steal a citizen's life.

Systemic Shift / Penalty: Upon discovery of prosecutorial misconduct, the prosecutor is strictly liable for reparations to the wrongfully convicted and faces incarceration for a term proportional to the false sentence served. Defense attorneys who weaponize procedural complexity to produce resource-exhaustion settlements in cases involving documented community harm face personal civil liability for the un-remediated portion of that harm.

E.3 — Engineers**SEPA Reference**

S.E.P.A. Sections 2.1, 2.2(a)(b)(c)(d), 3.3(b)(h)

Core Asymmetry

Technical comprehension monopoly vs. user/public dependency on system safety; professional seal authority vs. public reliance

Scope

Civil, mechanical, structural, and software engineers; systems architects; product managers

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Value-engineering safety out of a project under management pressure; signing off on a known-flawed flight control system to meet a market deadline; designing social media algorithms that optimize for psychological engagement via outrage and degradation; coding planned obsolescence.

Application: Engineers literally build the physical and digital world inhabited by people who cannot evaluate what they have built. That asymmetry scales the harm of engineering exploitation massively. An aerospace engineer who signs off on a flight control system known to be fundamentally flawed under management pressure cannot hide behind the corporate veil. A software engineer who builds a social media algorithm that produces empirically documented spikes in teen suicide — and whose engineering documentation reflects awareness of the harm — is strictly liable for the indirect harm. 'I was just writing the code I was assigned' is not a defense under strict liability.

Systemic Shift / Penalty: The professional seal becomes a strict-liability bond. If a civil engineer's certified design fails and produces loss of life due to a known design compromise, the engineer faces criminal liability. Software engineers and the product managers who commissioned provably harmful algorithms are jointly liable for the full population-level harm, as measured by the EHI. Pre-deployment safety certification replaces the current voluntary professional standards regime.

E.4 — Scientific Researchers and Academics

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(b)(c)(d), Preamble (c)
Core Asymmetry	Empirical authority and scientific method credibility vs. public reliance on research integrity
Scope	Academic researchers; clinical trial investigators; industry-funded scientists; journal editors

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: P-hacking (manipulating data to produce statistically significant but false results); suppressing negative trial results; designing studies with predetermined corporate-favorable outcomes; accepting fossil fuel funding to produce climate denial research; accepting sugar industry funding to produce research blaming dietary fat for heart disease.

Application: The public relies on science as the ultimate objective arbiter of reality. When a researcher accepts funding from an oil conglomerate to produce work that deliberately obscures the impact of carbon emissions, they are exploiting the public's trust in the scientific method. The indirect harm is global, intergenerational, and existential. The EHI for deliberate climate misinformation research is among the highest possible scores under the Act — because the downstream harm encompasses the entire atmospheric system and every population on earth.

Systemic Shift / Penalty: Falsifying or deliberately engineering data to manufacture a profitable consensus becomes an act of public endangerment. The researcher and the institution that published compromised work are liable for downstream policy failures and physical harm caused by manufactured misinformation. Journal editors who knowingly published compromised research are jointly liable. Reparations include full funding of corrective research programs at the offending institution's expense.

E.5 — Journalism and Information Publishers

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(a)(b)(c), Preamble (a)
Core Asymmetry	Narrative control and information distribution authority vs. public informational dependency
Scope	News publishers; media conglomerates; editors; social media platforms as publishers; broadcast networks

This section operates with careful attention to the First Amendment. S.E.P.A. does not regulate editorial judgment, political perspective, or the content of opinion. It targets the behavioral anomaly of monetizing demonstrably false information when the Actor knows the information is false and when that misinformation produces measurable physical harm to the public.

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Access journalism: burying critical investigative stories to preserve access relationships with powerful politicians; monetizing manufactured panic that produces measurable consumer or public health harm; publishing known falsehoods about public health matters (pandemic, vaccine, or environmental crisis) because the misinformation spikes viewership metrics; exploiting audience psychological vulnerability to generate profitable outrage culminating in real-world violence.

Application: Freedom of the press protects the right to publish. S.E.P.A. targets the behavioral anomaly of monetizing deceit. If a publisher knowingly deploys verifiable misinformation about a

public health crisis and that misinformation results in a measurable and localized spike in preventable deaths, the publisher has extracted ad revenue at the cost of human life. The standard is documentable: the Actor knew the information was false (internal communications are subject to OHM subpoena); the information was published; the harm is empirically measured.

Systemic Shift / Penalty: Existing defamation law protects specific individuals or corporations from reputational harm. S.E.P.A. extends protection to the public sphere. If a media conglomerate's executives architected a strategy of profitable outrage that produced measurable real-world violence, those executives are strictly liable for the physical remediation of that violence. The protection of editorial independence is not a shield for the deliberate monetization of harm.

ADDENDUM F — EDUCATION

Applying S.E.P.A. to education strikes at the structural core of how society distributes opportunity across generations. The education sector operates on two profound asymmetries: developmental vulnerability (the authority that adults and institutions hold over children whose capacity to consent, refuse, or exit is legally and practically constrained) and the credential monopoly (the power that institutions hold over a person's future economic survival by controlling access to the credentials that gatekeep it).

When the romanticized rhetoric of 'shaping young minds' is stripped away and the behavioral mechanics of harm and extraction are examined directly, the Act produces a radical restructuring of the educational architecture from pre-K through post-graduate credentialing.

F.1 — Public K-12 Education: The Geography of Destiny

SEPA Reference	S.E.P.A. Sections 2.2(c)(e), 3.3(j); Preamble (c)(g)
Core Asymmetry	State monopoly on compulsory education vs. developmental vulnerability of minors; property tax geography vs. educational equity
Scope	School boards; state legislators; superintendents; law enforcement in school settings; curriculum boards

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Funding schools via local property taxes (which mathematically guarantees inferior resources for lower-income communities); the school-to-prison pipeline (using law enforcement for routine discipline, funneling marginalized students into the juvenile justice system); manipulating curriculum to appease political donors at the expense of factual accuracy.

Application: Politicians and school boards defend unequal funding as a tradition of local control. Under S.E.P.A., motivation is irrelevant. If the funding architecture systematically deprives a specific demographic of functional literacy, physical safety, and developmental resources — causing measurable, long-term economic and psychological harm — it is classified as structural exploitation under Section 2.2(e). The state is exploiting the poverty of the community to subsidize the educational advantage of affluent districts. Zero-tolerance disciplinary policies that demonstrably funnel marginalized students into the juvenile justice system exploit children to maintain administrative convenience.

Systemic Shift / Penalty: School board members, state legislators, and superintendents who architect or maintain exploitative funding structures become strictly liable. Reparations require the immediate and aggressive redistribution of state funds to physically and academically rebuild harmed districts. Administrators who knowingly sustain the school-to-prison pipeline face incarceration for the irreversible destruction of the children's futures — classified as intergenerational harm under Section 2.2(c).

F.2 — Private and Charter K-12 Schools

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(b)(e), 3.3(g); Section 7(e)
Core Asymmetry	Public funding access vs. private operational discretion; institutional selectivity vs. public charter obligation

Scope

Charter school operators; private school administrators; school voucher program participants

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Cream-skimming: accepting public voucher money while counseling out or expelling high-needs students, special education students, or behavioral risks to maintain test scores; discriminatory admissions using public funding; operating without public accountability while extracting public resources.

Application: If a charter school accepts a single dollar of public funding and subsequently engineers its enrollment to exclude special education students, it is committing simultaneous extractive and non-extractive exploitation. It extracts public wealth while externalizing the cost and labor of educating the most vulnerable students back onto the underfunded public system that must absorb them. The defense of being a private entity making independent admissions decisions evaporates — the public funding relationship creates an unambiguous obligation of non-exploitation to the public.

Systemic Shift / Penalty: The founders and executives are personally liable for refunding the full value of extracted public funds, and the institution is dissolved or absorbed into the public trust. Any school receiving public funds of any kind — vouchers, tax credits, grants — is fully subject to the Act's prohibitions and to OHM outcome monitoring. The private designation is a legal status, not an exploitation exemption.

F.3 — Higher Education: Public and Private Universities

SEPA Reference

S.E.P.A. Sections 2.1, 2.2(a)(b)(c), 2.4; Preamble (c)(g)

Core Asymmetry

Credential monopoly vs. 18-year-old financial illiteracy; institutional prestige vs. graduate economic outcome

Scope

University presidents; boards of trustees; financial aid offices; athletics programs; campus judicial systems

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: Predatory tuition inflation structured to extract maximum federal student loan debt from teenagers who cannot meaningfully evaluate thirty-year return on investment; the adjunctification of instructional labor (replacing full-time faculty with contingent labor at poverty wages while charging full tuition); using NDAs and internal tribunals to suppress reports of campus sexual violence to protect enrollment metrics.

Application: Universities currently operate, in many cases, as hedge funds with tax-exempt educational side-hustles. If a university structures its tuition to extract the maximum amount of federal student debt from an 18-year-old, knowing statistically that the credential being sold produces a negative long-term financial return, the university is guilty of severe financial exploitation of developmental vulnerability and financial illiteracy. The credential monopoly is the mechanism; the debt trap is the harm. University presidents who deploy NDAs to suppress sexual assault reports — exploiting a victim's trauma to protect the school's enrollment metrics — face direct incarceration for recurrence without caring.

Systemic Shift / Penalty: Under strict liability, universities become the financial guarantors of their own outcomes. If a cohort of graduates defaults on loans because the institution sold a credential with a statistically documented negative ROI, reparations are extracted directly from the university's endowment to make the students whole. This fundamentally restructures the economic incentive of higher education from tuition maximization to graduate outcome optimization.

F.4 — Educational Technology and Testing Monopolies

SEPA Reference	S.E.P.A. Sections 2.1, 2.2(b)(c), 2.4; Section 3.3(a)
Core Asymmetry	Algorithmic opacity vs. student captive dependency; gatekeeper credential authority vs. applicant economic vulnerability
Scope	EdTech companies; standardized testing agencies; data brokers using educational data; biometric surveillance in schools

EXPLOITATIVE BEHAVIOR PATTERN

Behavior: EdTech companies providing 'free' software to school districts while quietly extracting student behavioral or biometric data for commercial AI training or third-party sale; standardized testing monopolies that empirically and consistently produce outcomes that discriminate against specific socioeconomic classes while charging exorbitant examination fees.

Application: A student cannot consent to data collection — they are a captive audience in a compulsory system with no alternative provider. If an EdTech company extracts behavioral data to train commercial AI while a student merely tries to learn arithmetic, it is the purest application of the exploitation definition: an Actor leveraging a structural asymmetry (mandatory use, no alternative, no meaningful consent) to extract value (commercial training data) from a Vulnerable Party (a minor in a compulsory educational setting). Testing monopolies that function as de facto gatekeepers to economic mobility while producing empirically discriminatory outcomes are exploiting their gatekeeper authority.

Systemic Shift / Penalty: EdTech executives who harvest minor student data face immediate asset seizure and incarceration for exploiting minors — a strict liability category that carries no mitigating defenses. Testing agencies are required to empirically certify through OHM review that their instruments do not produce systemic socioeconomic harm; failing certification, they are dissolved and replaced by public alternatives. Executives are held personally liable for the lost wages and economic suppression of the demographics whose opportunities their instruments gatekept.

ADDENDUM CONCLUSION — THE UNIFIED FRAMEWORK

Across all six addendum sections, the same analytical core applies: identify the structural asymmetry that enables exploitation, measure the resulting harm against the Exploitation Harm Index, hold the responsible Actors strictly liable regardless of motivation, and mandate reparation proportional to the full scope of harm — including its indirect, intergenerational, and ecological dimensions.

The cross-sector application of this framework reveals a structural truth that sector-specific regulation consistently obscures: the mechanisms of exploitation are the same regardless of context. The financial services company that charges overdraft fees to the person who cannot afford them, the hospital administrator who denies a necessary procedure to protect quarterly earnings, the legislator who strips nutritional assistance from the poor to fund a tax preference for the wealthy, the religious institution that protects its abusers to protect its revenue — all share an identical operational structure: an Actor with structural power extracts value from a party whose vulnerability is the product of that same power differential.

S.E.P.A. treats that structure as the violation, regardless of the sector, the institution, the legal status, or the publicly stated motivation of the Actor. This is the meaning of the behavioral anomaly standard: it is not a claim about intent, ideology, or morality. It is a systems engineering specification. The system is producing harm. The harm is measurable. The Actor responsible for operating the system is liable. The system is redesigned.

IMPLEMENTATION NOTE — The EHI as the Unifying Instrument

The Exploitation Harm Index, described in Section 2.7 of the core statute, is the technical mechanism that makes this cross-sector framework enforceable rather than aspirational. A single, standardized, peer-reviewed, publicly transparent measurement instrument that can be applied consistently across corporate asset-stripping, judicial docket manipulation, curriculum falsification, and data harvesting from minors is what transforms S.E.P.A. from a political statement into a governable system. The development of the EHI is the highest-priority implementation task, and it must be insulated from the influence of every sector addressed in this Addendum.

Add	Domain	Core Asymmetry
A	Economic Sectors and Markets	Capital/expertise vs. labor/consumer dependency
B	Government — Extractive Exploitation	Sovereign authority vs. citizen dependency; immunity doctrines vs. accountability
C	Government — Non-Extractive Exploitation	Information control and procedural authority vs. democratic reliance
D	Organizations by Type	Institutional authority and tax status vs. beneficiary/congregant vulnerability
E	Licensed Professions	Expert knowledge monopoly vs. public reliance on professional integrity
F	Education	Developmental vulnerability and credential monopoly vs. student/family dependency
